

Channel Islands Audio VPC•3

Passive Controller

VPC•3 Passive Controller is a simple audio volume control/input selector, yet offers great performance and flexibility. Audio purists have recognized most signal sources, outboard DAC's, and Phono preamps, have plenty of signal to drive an amplifier directly, without passing through another active gain stage, which adds distortions and coloration.

Similar to it's predecessors VPC•1 & VPC•2, the new version is equipped with 2 pair of inputs and a front panel switch for selection of "Input 1", "Mute" and "Input 2". A second pair of output jacks have been added for increased flexibility. The main pair are variable through the volume control, while the 2nd pair can be internally configured as another variable pair for bi-amping or use with a powered subwoofer, or can be configured as a fixed level output. This allows the selected input to be sent to a recording device or second system.

Our new ALPS® Blue Velvet precision potentiometer uses offers excellent sound quality, channel to channel tracking, and long life. Careful design layout using gold-plated circuit board, silver solder construction, and short signal path are used for best conductivity and optimum performance. All jacks, switches, and jumpers are high quality with gold plated contacts.
